Resume – Backend / SDE Intern

Swastik Mishra

Bengaluru, India · +91-9870488896 · swastiksta@gmail.com · LinkedIn · GitHub · LeetCode

Education

New Horizon College of Engineering, Bengaluru — B.E. in Computer Science and Engineering · 2024 – 2028 (expected)

CGPA: **9.05 / 10** (through 4th semester)

Technical Skills

- **Languages:** Java, C, SQL, Python (basic), JavaScript, HTML/CSS
- **Backend:** Spring Boot, Spring Data JPA / Hibernate, REST APIs, Spring Scheduler, Bean Validation, Microservices (learning)
- **Databases:** MySQL
- **Tools:** Git, GitHub, Maven, Docker, Postman, JUnit
- **AI integration:** LLM APIs (Meta Muse Spark), structured JSON output, vision-based document parsing
- **Core CS:** Data Structures & Algorithms, OOP, DBMS, Operating Systems, Computer Networks, Cloud Computing

Projects

UPI Payment Verification Gateway — *Java 17, Spring Boot 3, MySQL, Spring Data JPA, Meta Muse Spark LLM, ZXing, Docker* · GitHub · Demo

- Built solo for the Meta AI Hackathon 2026: a zero-fee gateway that auto-matches direct UPI payments to orders, removing the ~2% aggregator fee for small merchants.
- Designed unique-paise order matching (₹100 → ₹100.37), so every incoming payment maps to exactly one pending order without relying on UPI notes.
- Automated end-to-end settlement by configuring a MacroDroid macro that forwards bank SMS from an Android phone to the gateway's webhook in real time; an LLM extracts amount, UTR and direction from any bank's SMS or a screenshot, replacing per-bank regex rules.

- Guaranteed payment integrity with `BigDecimal` money, unique-UTR constraints, transactional settlement with optimistic locking (`@Version`) and a fail-closed path when the AI is unavailable.
- Added fraud checks (duplicate UTRs, debit SMS, late payments, forged webhooks via shared secret), a scheduler that expires unpaid orders after 5 minutes, and a full audit trail; covered core logic with JUnit tests.
- Exposed 7 REST endpoints with DTO-based responses and global JSON error handling, plus a QR-code dashboard that works with any UPI app.

AI-Powered Grievance Management System *(In Progress) — Spring Boot, Spring Security + JWT, MySQL, Python, FastAPI, scikit-learn, React* · GitHub

- Designing a full-stack platform where users file complaints that an NLP model (TF-IDF + Logistic Regression) categorises, prioritises and routes to the right department.
- Building the Spring Boot backend with JWT role-based access (User / Officer / Admin), tracking IDs and a status lifecycle, calling a Python FastAPI ML microservice.
- Planned scheduled escalation of overdue grievances, email alerts on status changes and an admin analytics dashboard; team of 2, college mini-project.

Achievements

- **Finalist, SAP Hackfest**; participated in **5+ hackathons**, including the Meta AI Hackathon 2026 (solo).
- Solved **230+** problems on LeetCode (arrays, strings, trees, graphs, dynamic programming).

Certifications

- **Cloud Computing** — NPTEL (IIT), Jan–Apr 2026 · **Top 1%**
- **Computer Networks** — NPTEL (IIT), Jul–Dec 2026 · **Top 1%**
